Research is necessary to understand the problems that affect individuals, communities or health systems. It allows for a systematic and scientific assessment or evaluation of the problem and often provides knowledge that allows for change to occur – change that can improve the quality of health and health care. No organisation or health institution can grow or develop without the use of research.

The major problems facing research today is the lack of application of research findings. Conducting research for “research sake” or the “publish or perish mentality”, has resulted in a flood of research publications that have little impact on health – the 10/90 gap in medical research (only 10% of global research funding is spent on health problems that affect 90% of the world’s population). What is required today is applied research – research that impacts the health of the individual and the community, resulting in meaningful improvement in health status.
