

- Surgery on large left adrenal tumor (7cm), which on biopsy came as adrenal schwannoma, extremely rare tumor in itself. Did laparoscopic adrenalectomy along with guidance from Dr. Tarun sir. It was a difficult laparoscopic surgery owing to its location & large size but we were able to successfully dissect it from nearby vital structures like aorta, pancreas & spleen, which were densely adherent to tumor. Operating on adrenal tumor is a challenge for both to surgeon & anesthetist and requires fine pre & post op care with good teamwork. Surgical treatment is curable in most cases of this rare tumor. Thanks to Dr. Tarun sir for thorough guidance, Dr. Ajita Mishra with Anesthesia team & staff for constant support and care.
